

Joel Hoke

Strategic Experience Architect | AI Experiences & Intelligent Systems

ABOUT

Over the past eight years, I've worked at the intersection of product design, business strategy, and increasingly AI—helping transform complex operational systems into experiences that feel intuitive, thoughtful, and human.

I design products by understanding **the people and the business** they're meant to serve.

EXPERIENCE

Microsoft

2019–2026

Senior Product Designer

Led end-to-end design for enterprise experiences used across Microsoft's global workforce. Redesigned the global compensation platform, created AI-powered operational experiences, and built interactive and coded prototypes to accelerate product decisions.

Avanade

2017–2019

Visual Designer

Translated complex business, user, and technical requirements into intuitive enterprise products for Fortune 500 clients.

Indiana Pacers

2016–2017

Internal Designer

Designed digital experiences and led the visual identity supporting the franchise's 50th Anniversary campaign.

SELECTED IMPACT

AI Experiences

Designed AI-powered enterprise experiences connecting front-end dashboards with intelligent agents. Enabled employees to navigate complex operational systems through AI-assisted workflows.

Global Compensation

Led the redesign of Microsoft's global compensation experience for more than 150,000 employees. Simplified a complex enterprise system into a more intuitive and transparent experience.

Design Leadership

Cultivated an inclusive, collaborative design culture through mentoring, workshops, and cross-functional leadership. Served as Engagement Lead for Mixed at Microsoft, supporting the company-wide inclusion network.

DESIGN PHILOSOPHY

Transform complexity into confidence.

The best products don't ask people to understand the system. They help the system understand the people. Whether I'm designing enterprise software, AI-powered experiences, or consumer products, my goal is to make sophisticated systems feel clear, thoughtful, and human.

CURRENT FOCUS

AI as an orchestration layer.

I'm exploring the intersection of AI, intelligent buildings, and operational systems—building prototypes, experimenting with agentic workflows, and investigating how thoughtful product design can transform complex real estate operations into intuitive, connected experiences.

HOW I WORK

I prototype early to answer questions quickly.

I enjoy ambiguity and help teams create clarity.

I believe the best ideas emerge through collaboration.

I use storytelling to align teams around a shared vision.

I care deeply about craft—and even more about solving the right problem.

WHAT I'M CURIOUS ABOUT

I'm increasingly fascinated by industries where physical and digital systems intersect. Intelligent buildings, connected operations, and AI-assisted decision making represent a unique opportunity to rethink how people interact with complex environments.

The future of enterprise software isn't more software. It's better coordination.

AI as orchestration

How might intelligent systems coordinate work across platforms instead of becoming another interface people need to manage?

Context over dashboards

How can products surface what matters at the right moment—based on intent, environment, and operational conditions?

Buildings as living systems

How can connected-building data become clear, actionable guidance rather than another stream of information?

Designing for confidence

How can sophisticated operational software quietly reduce cognitive load and help teams make better decisions?

LOOKING AHEAD

I'm looking for a team that believes great design can simplify complexity, AI can augment human expertise, and the next generation of products will be defined by how intelligently systems work together—not by how many features they contain.
